

Binary Search

Algorithm Searching an element in a sorted array by iterative method

```
1: procedure BINARYSEARCH( $A \leftarrow \text{sorted array}$  ,  $x \leftarrow \text{target}$ )
2:    $l \leftarrow 0$ 
3:    $r \leftarrow [(length\ of\ A) - 1]$ 
4:   while  $l \leq r$  do
5:      $m \leftarrow \lfloor l + (r - 1)/2 \rfloor$ 
6:     if  $A[m] == x$  then
7:       return  $m$ 
8:     end if
9:     if  $A[m] > x$  then
10:       $r \leftarrow (x - 1)$ 
11:    else
12:       $l \leftarrow (x + 1)$ 
13:    end if
14:  end while
15:  return  $-1$ 
16: end procedure
```

Algorithm Searching an element in a sorted array by recursive method

```
1: procedure BINARYSEARCH( $A \leftarrow \text{sorted array}$ ,  $l \leftarrow \text{left bound}$ ,  $r \leftarrow \text{right bound}$ ,  $x \leftarrow \text{target}$ )
2:   if  $l > r$  then
3:     return  $-1$ 
4:   end if
5:    $m \leftarrow \lfloor l + (r - 1)/2 \rfloor$ 
6:   if  $A[m] == x$  then
7:     return  $m$ 
8:   end if
9:   if  $A[m] > x$  then
10:    return  $BinarySearch(A, l, m - 1, x)$ 
11:  else
12:    return  $BinarySearch(A, m + 1, r, x)$ 
13:  end if
14: end procedure
```
